Motivazione e campo di applicazione
Experimentally renal tissue hypoxia appears to play an important role in the pathogenesis of chronic kidney disease (CKD)

Obiettivi generali e principali attività
In this study we measured renal tissue oxygenation and its determinants in humans using blood oxygenation level-dependent magnetic resonance imaging (BOLD-MRI) under standardized hydration conditions. Different coronal slices were selected, and a multi gradient echo sequence was used to acquire T2* weighted images.

Obiettivi di apprendimento (strumenti tecnici e analitici, metodologie sperimentali)
- study different tools and methods of applying BOLD-MRI analysis on CKD
- select best tool for BOLD-MRI analysis and test feasibility on images of children and neonates

Luogo/i in cui si svolgerà il lavoro: DIBRIS - Gaslini
