### Description

#### Motivation and application domain

The goal of this project is to test the influence of haptic feedback on motor memory when learning a novel motor task.

#### General objectives and main activities

1. To create a task by programming a bimanual robot that allows precise control of the variability experienced during learning of a novel motor task and to apply haptic perturbations.
2. To test human subjects learning the task – participants will be assigned to different groups where each group will learn with different amount of variability and will experience different haptic feedback. Kinematic and force data will be recorded throughout the training sessions.
3. To analyze the data in order to investigate the effects haptic feedback on the motor memory of the task.

#### Training Objectives (technical/analytical tools, experimental methodologies)

1. Theoretical basis of motor learning and variability
2. Designing experiments and protocols on the KINARM Robotic manipulandum
3. Working and testing with human subjects
4. Data analysis and statistical testing

#### Place(s) where the thesis work will be carried out:

Michigan State University, Department of Kinesiology
