Title (tentative): Analysis of synaptic signaling in human iPSC derived neuronal cultures on MEA

Thesis advisor(s): Martinoia Sergio, Dirk Schubert (Radboud University, NL)

E-mail: Sergio.Martinoia@unige.it

Phone: (+39) 010 33 52251

Description

Motivation and application domain

General objectives and main activities
Main objective is to study on a new experimental model, namely, human iPSC derived neurons coupled to Micro Electrode Arrays network functional organization and development. The electrophysiological characterization will be carried out by coupling iPSC derived neurons onto MEA. Specific protocols will be developed and custom data analysis implemented.

Training Objectives (technical/analytical tools, experimental methodologies)
Network electrophysiology. Phenotype characterization in terms of action potentials and LFP.

Place(s) where the thesis work will be carried out: Radboud University (Nijmegen, NL)

Additional information

Pre-requisite abilities/skills: neurobiology and neuronal signaling. Extracellular electrophysiology

Maximum number of students: 1

Financial support/scholarship: Erasmus+
