**Description**

**Motivation and application domain**

- Development of high-throughput systems for drug screening
- Test and validation of new device-systems

**General objectives and main activities**

The main objective is to test and optimize an existing system constituted by a multiwell plate in which the 24 wells contain a small micro-electrode array for electrophysiological measurements.

The focus of the activity will be to set up the system in collaboration with CNR-IBF (Institute of Biophysics) and to perform experiments with neuronal cells and specific chemical compounds whose mode of action is known. In parallel a specific sw will be adapted and optimized to automatically extract dose-response curves.

Finally the experimental results will be critically analyzed and discussed.

**Training Objectives (technical/analytical tools, experimental methodologies)**

- Use of advanced instruments for network electrophysiology.
- Software development (Matlab).
- Design of experimental protocols.
- Analysis of neuronal signals for neurotoxicity.

**Place(s) where the thesis work will be carried out:**

- Neuroengineering and Neurotechnologies Lab@UNIGE;
- CNR-IBF
